

# Electoral Reform and Pork Barrel

## **in Parliamentary Questions**

---

David Yen-Chieh Liao

PhD Candidate at Department of Government in University of Essex

Predoctoral Research Fellow at the Chair of Comparative Politics in University of Bamberg

- **Motivation:**
  - How does the electoral reform change legislators' preference and their intentions to bring home the bacon?
- **Theoretical Expectation:**
  - Scholars have clearly explained why intraparty competition by different rules of electoral systems increases legislators' incentives to run on a personal reputation
  - We however know little about whether actual impacts introduced by the electoral reform through MMD (Multi-members District) to SMD (Single-member District) reduce legislators' motives to purse pork barrel project in the legislature.
- **Data and Method:**
  - I train deep learning models using Convolutional Neural Networks on top of embedding layer extracted from *Transformer BERT* to evaluate pork-barrel activities in parliamentary questions.
  - Approximately 150,000 PQs since 1993
- **Major Finding:**
  - Evidence exists to show that legislators under MMD are more likely to express political intention about pork-barrel projects in written parliamentary questions.
  - The reform have heterogeneous impacts on large parties vis-à-vis small parties.

Legislative activities such as legislative votings, debates (e.g, ParSpeech V2) and parliamentary questions (e.g, LACAN) play a significant role in most democracies.

**Roll Calls:** Legislative votings are generally dominant by party

**Debates:** MPs are not equally access to floor speech

- *Slapin et. al (2018): Politicians grandstand strategically against party in the British Parliament*
- *Park (2021): in US House committee Hearings*

The advantages of using the PQs:

comprehensive, accessible, and rich

The party leadership have less control over MP's motivation to employ parliamentary questions (*Shane 2011*).

Parliamentary questions may reveal MPs' interests in policy preference (*Shane 2011; Saalfeld 2011*).

MPs ask questions for several reasons:

- Because of their **expertise** or domain responsibility of delegation for question topics.
- Personal preference such as their nature of **substantive representation** (*Russo 2021; Saalfeld 2011; Martin 2011*)
- Electoral motivation: **personal reputation** (*Martin 2011*)

## In this paper:

- I introduce the case of **Taiwan Legislative Yuan**, where the electoral system reformed through SNTV to SMD, to evaluate how electoral motives shape legislators' tendency to pork-barrel projects under different electoral systems.
- Parliamentary questions are the primary channel for legislators to **scrutinize the government** and **express political intentions**.
- These parliamentary questions allow identification of different **question topics, categories** and further information regarding **legislators' opinions of policy interests and agenda at the individual level**.

## Electoral Reform in Taiwan

- The SNTV-MMD was the major system to elect legislators before 2008 in Taiwan.
- This was thought to intensify majority-seeking parties to run more than one candidate in a district, which increases incentives for candidates to run on personal votes against their party reputation (Cox 1990; Carey and Shugart 1995).
- The SNTV in Taiwan was criticized for creating **excessive intra-party chaos and competition** (Cox 1990; Hirano 2006; Ames 2001), as well as **encouraging factional and candidate-centered electoral politics** (e.g. Batto and Huang 2016; Wu 2003).

## Theoretical Expectation

- Under SNTV, co-partisan candidates cannot rely exclusively on their party reputation and have to find an alternative means of attracting votes by **running on a personal reputation** via **providing particularistic services** (Cain, Ferejohn, and Fiorina 1987; Reed 1994; Carey and Shugart 1995).
- Luor and Liao (2009) finds that the more pork-barrel legislation legislators propose, the higher grant allocation the municipalities (districts) receive.
- Catalinac (2016) finds that LDP (Liberal Democratic Party) candidates under the SMDs in Japan adopted new electoral strategies by mentioning programmatic policies such as national security.

## Hypothesis:

*Hypothese I: Under the SNTV-MMD, legislators are more likely to propose the questions regarding the provision of particularistic goods.*

*Hypothese II: Under the SMD-MMM, legislators are more like to ask the questions related to programmatic and regulatory policies*

## Training Deep Learning Model

- Existing labelled pork legislation from 2007 to 2008

- Train a machine to identify pork-barrel features on parliamentary questions over time.

## Regression Analysis

- Regression analyses are employed to answer the research questions.

- Control for the effects from legislators and municipalities across the years.

## Training Data: Pork-barrel Legislation

The gold standard for identifying the pork-barrel legislation is based on the target beneficiaries of the policy (distributed vs concentrated) and attributes of policy cost (distributed vs concentrated).

Typical pork-barrel policies (or legislation) mainly incur distributed costs while generating parochial benefits for specific regions or *uldesignated population groups*.

## Number of Train/ Test Splits

- The collection of this data set consists of 7243 pieces of legislation which were annotated as Pork (with label 1) or Non-Pork (with label 0).

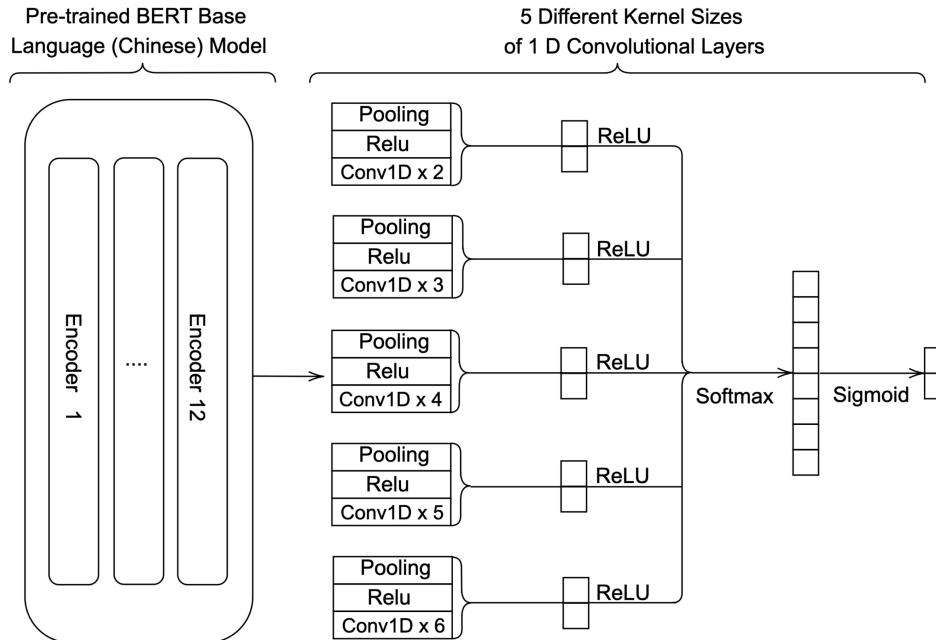

- This dataset was cross-coded by three social science researchers to perform its validity, which achieves 98% in terms of consistency and preciseness among coders (Luor and Hsieh 2008; Luor and Liao 2009).

## Strength

self-attention mechanism

dealing with unseen words, in particularily in Chinese (unspaced language).

District Fixed Effects		✓		✓		✓
Legislator Fixed Effects		✓		✓		✓
The Reform Year	✓	✓	✓	✓	✓	✓
Observations	4,252	4,252	3,539	3,539	713	713
Adjusted $R^2$	0.016	0.218	0.020	0.233	0.003	0.179

Note: \*  $p < 0.10$ , \*\*  $p < 0.05$ , \*\*\*  $p < 0.01$ . Robust standard errors in parentheses. The district-level pork-barrel parliamentary question at quarter-yearly is regressed on year, electoral reform, and interaction between year and electoral reform, with and without controls. Controls include fixed effects for electoral districts, municipalities, and individual legislators and the occurrence of the reform.

(a) Major Parties: KMT and DPP

(b) Minority Parties: Others

Figure 6: The Average Number of Pork Barrel Question By Years

## Takeaway

- Evidence exists to show that legislators under SNTV are more likely to ask pork-barrel projects in the questions.
- The reform demonstrates heterogeneous effects on major parties vis-à-vis the minority parties

## The Limitation:

**Training Data:** The pork barrel legislation from training data used in this paper has been nearly ten years. The deep learning classifier might fail to capture unknown/undeve concepts developed in the post-reform period.

**Social Media?:** A steady decrease in the total number of PQs since 2003

Thank You
